Second volume is sanctified the questions of pneumatic transport diphasе streams «gas-particulate matters». On the basis of mechanics of heterogeneous environments mechanics of portage of diphasе streams is examined taking into account the rotation of particles locomotive in the stream of gas. Basic to law of pneumatic transport of friable materials from ejecting air from an atmosphere conformities. Efficiency is reasonable of vibropneumatic method of loading and acceleration of friable material in a transport pipeline.

For research workers and engineers, engaging in the problems of pneumatic transport of friable materials, and also for students on specialty «Industrial transport».
